Abstract of DE19851883

A permanent-magnet polyphase machine includes a laminated rotor core (1) in which are embedded permanent magnets (2). At least one magnetic flux blocking device (5) is provided between a recess (4) for receiving a permanent magnet (2), consisting of a magnetic plate, and the airgap of the polyphase (synchronous) machine. A sinusoidal exciter field can be generated in the airgap, and the magnetic flux blocking devices (5) are specifically material cut-outs or slots having a preferred direction of orientation mainly parallel to the magnetic field lines set up during operation of the electrical machine.
